//note="Vector: pAMP10; cDNA, was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT).
From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA, selection using chromosome 7 genomic DNA (cosmids). The resulting direct-selected cDNA was cloned into a plasmid vector using a non-directional uracil DNA glycosylase (UDG)-mediated cloning strategy."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PT gene mapping, and selective breeding
PS Table 7; Page 331; 51/pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine MboI DNA fragments of between
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC 000. The sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequence upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC oppirent). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of polymorphic genetic markers of the form pletection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers placed mols. as primers placed mols. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) grobe. Over 100 repeat blooks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf34 which contains the repeat sequence having the formula: (AC)4AT(AC)15.
                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

PT Polymorphic bovine DNA markers - used in genetic identification, price and selective breeding gene mapping, and selective breeding gene mapping, and selective breeding a gene mapping, and selective breeding PS Table 7; Page 213; 51/pp; English.

CT he sequence is that of a bovine microsatellite sequence obtd. by creaming a library of bovine microsatellite probe.

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe.

CC one out of 50 clones cross-hybridised. Assuming independent clastribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, compared to information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program complification of the corresp. microsatellite (using the program complification and in the genetic mapping of economic trait corresp. in cattle, to allow selective breeding.

CC correct category testing, and in the genetic mapping of economic trait correct c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation. See Q27389-Q27404 and Q33141-Q33144.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pr Detection of polymorphic genetic markers of the form
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
ps Disclosure; Column 9-10; 186p; English.

CC The invention relates to the isolation of polymorphic repeat sequences
CC The invention relates to the isolation of polymorphic repeat sequences
CC The invention relates to the solation of polymorphic repeat sequences
CC thaving the sequence (dC-dA)n. (dG-dT)n which can be used to detect these
CC repeats, especially for use in e.g paternity or maternity testing,
CC chuman genetic analysis such as linkage analysis of genetic disease,
CC commercial animal or plant breeding or pedigree analysis. Clones
CC commercial the repeat sequences were isolated by hybridisation of
CC chromosome-specific phage libraries with a synthetic poly(GC-dA). (dG-dT)
CC probe. Over 100 repeat blocks were isolated. The inserts from the clones
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been determined are shown in T65704-797.
CC sequence has been dete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telomere and nucleic acid for recombination yeast centromere, marker, and telomere and nucleic acid for recombination of the sequence for the PCR primer used in the Sxample 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the camplification of the Alu repeat sequence, which is used to amplification of the Alu repeat acids from the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of the mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

CT The sequence is that of a bovine microsatellite sequence obtd. by

CC Screening a library of bovine MboI DNA fragments of between

CC One out of 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross-hybridised. Assuming independent

CC One out of 50 clones cross-hybridised. Assuming independent

CC One out of some sequence information for ca. 230 such bovine microsatellites

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC out of sequence information for ca. 230 such bovine microsatellites

CI summarised in the specification and indexed herein (see below).

CC were used to generate the required PCR primers for in vitro

amplification of the corresp microsatellite (using the program

CC optifrim). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC loci, or genes involved the determinism of economically important

CC see also Q33501-34437.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can
                                                                                                                                                                                         be used to detect genetic variation.

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/267,803B
FILING DATE: 28-JUN-1994
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
REGISTRATION NUMBER: 36,602
REFERENCE/DOCKET NUMBER: 110.00030120
TELEPHONE: 612-305-1217
TELEPHONE: 612-305-1217
INFORMATION FOR SED ID NO: 45:
SEQUENCE CHARACTERISTICS:
LENGTH: 54 base pairs
myde: nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 4

Sequence 57, Application US/08450673C
Patent No. 5948888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 INVERTAL INFORMATION:

APPLICANT: de la Monte, Suzanne
APPLICANT: wands, Jack R.

TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TELEFAX: (202) 371-2540 INFORMATION FOR SEQ ID NO: SEQUENCE CHARACTERISTICS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TRANDEDNES:

year emapphing, and selective breeding
Table 7; Page 271; 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
concept of 50 pwith an (Ac)15 and a (TC)15 oligonuclectide probe.
The sequence in the scross-hybridised. Assuming independent
cone out of 50 clones cross-hybridised. Assuming independent
cone of microsatellites and MboI sites, the frequency of
cone out of 50 clones cross-hybridised. Assuming independent
cone is summarised in the specification and indexed herein (see below).
The sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
were used to generate the required PCR primers for in vitro
amplification of the corresp. microsatellite (using the program
of pripring). The microsatellites may be used to identify individuals,
confirming, and in the generatic mapping of economic trait
traits esp. in cattle, to allow selective breeding.

Example 2; Page 42; 82pp; English.
Competition experiments using the DNAseI protection assay showed
that an oligonucleotide contg. 15 tandem ATT repeats was an
effective competitor for binding of the HeLa factor. This oligo was
used to prepare an oligonucleotide affinity column for purification
of RIF60 from Chinese hamster cells. The protein recognises and
binds to an (ATT)n motif in the diffr gene ori. It can also bind to
the yeast ARSI domain B. See Q22753 and Q24811.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PT New biocompatible medical devices and articles - using a lactic pri acid-glycolic acid polyester in which monomer units are pri acid-glycolic acid polyester in which monomer units are principled provided polyester genes given in Q71814-16 represent fragments of the Synthetic polyester genes given in Q71801-02. These fragments were commended in the production of the full length polyester gene in the plasmid contains the necessary initiator sequences and the contains the necessary initiator sequences and the contains the necessary initiator sequences and the contains the complete polyester coding sequence ligated in frame with the leader sequence. The expressed sequence represent synthetic contains the complete polyester coding sequence ligated in frame with the leader sequence. The expressed sequence ligated in frame with the leader sequence. The expressed sequence stop codons is reversed for the codons, UAA, UAG and UAA, one of these stop codons is reversed for the codons, UAA, UAG and UAA, one of these stop codons is reversed for the codons, UAA, UAG and UAA, one of these stop codons is reversed for the codons signal for the polyester. The remaining two stop codons are coded by UAA and UAG, respectively. Initiation of translation always starts at an AUG codon. This is accomplished through the use of a specially modified Met-thNAA modified be carry contained to remove the Met. Suppose browled to remove the Met. Suppose and scarry contains and screws.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pri New biocompatible medical devices and articles - using a lactic pri acid-glycolic acid polyester in which monomer units are rindividually and specifically determined represents a fragment of the plasmid psport ic which recontains the 5 fragment of the synthetic genes which encode polyesters, cc contains the 5 fragment of the synthetic genes which encode polyesters in 071801-02, under the control of the E. coli trpA transcription cc initiator and followed by FokI and HindIII restriction sites. A further fragment of the synthetic genes were ligated into psport Ic to give plasmid psport Id (see also Q71810-11), with the final fragment being coinserted in a third round of ligation to give psport Ic (see also Q71812-13). The E. coli trpA initiator sequence was used to express the full clampth sequences given in 071801-02 in an E. coli cell free medium. The expressed sequences represent synthetic genes which were used in the comming acid except Pro. Of the three stop codons, UAA, UAG and UGA, one cof the polyester. Lactate and glycolate are encoded by UAA and CC units of the polyester. Lactate and glycolate are encoded by UAA and CC UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an AUG codon. This is accomplished through the use of a specially modified CC resulting polymer is treated with cyanogen bromide to remove the Met. CC c-polymers produced in this manner may be used to produce sutures, staples, clips, drug delivery devices, pins and screws.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-JUL-1994.

Table 7; Page 178; 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine mol DNA fragments of between
250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe.
One out of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and Morio sites, the frequency of
(T6)n >9 microsatellites in the bovine genome is estimated at >100,
000. The sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
                                                                                                                                                                                               Georges M, Massey JM;

PT Polymorphic bovine DNA markers - used in genetic identification,

PT Polymorphic bovine DNA markers - used in genetic identification,

PT Polymorphic bovine DNA fragments of between company and selective breeding

PS Table 7; Page 178; 517pp; English.

CC The sequence is that of a bovine Microsatellite sequence of the frequency of company of microsatellites and Mbo! sites, the frequency of company of microsatellites and Mbo! sites, the frequency of company of the sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program opping in the program opping of economic trait company of the microsatellites may be used to identify individuals, company of the microsatellites may be used to identify individuals, company of the corresp. microsatellite sequence of identify individuals, company of the program of the microsatellites may be used to identify individuals, company of the program of in the genetic mapping of economic trait sep. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   were used to generate the required PCR primers for in vitro amplification of the corresp, microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            libraries
Claim 4; Figure 3A; 13pp; English.
Claim 4; Figure 3A; 13pp; English.
Claim 4; Figure 3A; 13pp; English.
The inventors claim an asymmetrically tailed plasmid primer comprising a cut,ds DNA plasmid contg. a functional origin of replication and at least one functional selection marker gene, one 3' terminus of which contains an oligo (dT) extension, the other 3' terminus of which contains an oligo (dC) or oligo (dG) extension terminated by a 3' phosphate group. More specifically, the asymmetrically tailed plasmid primer is produced by SacI and KpnI cleavage of plasmid pLP, and each terminus produced by the cleavage is joined to the complementary adaptor, which is Q52731 or Q52732.

Asymmetrically tailed plasmid primers - comprises cut,
double-stranded DNA plasmid, useful for producing cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Asymmetrically tailed plasmid primer; Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q52734 standard; DNA;
Q52734;
Claim 5; Figure 3B; 13pp; English.
The inventors claim an asymmetrically tailed plasmid primer comprising a cut.ds DNA plasmid contg. a functional origin of replication and at least one functional selection marker gene,
                                                                                                                                wpi; 93-404926/50.
Asymmetrically tailed plasmid primers - comprises cut,
double-stranded DNA plasmid, useful for producing cloning
                                                                                                                                                                                       Margolskee

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chondrocytes and inhibits vascular endothelial cell growth of Example 4; Page 10; 34pp; English.

Q78635 and Q78636 are a pair of primers for Q78627-Q78632 which encode R65486-R65491 respectively, human chondromodulin-1 (CM-1), a chondrocyte growth regulator. CM-1 as part of a pharmaceutical compsn. with a carrier, excipient or solvent, can be used to stimulate chondrocyte growth. CM-1 also inhibits vascular endothelial cell growth, by promoting the differential potency of chondrocytes.
